

RE³ASON: A tool for the analysis and optimization of urban energy systems

Kai Mainzer

100ee erneuerbare energie region
Covenant of Mayors
Committed to local sustainable energy
European energy award

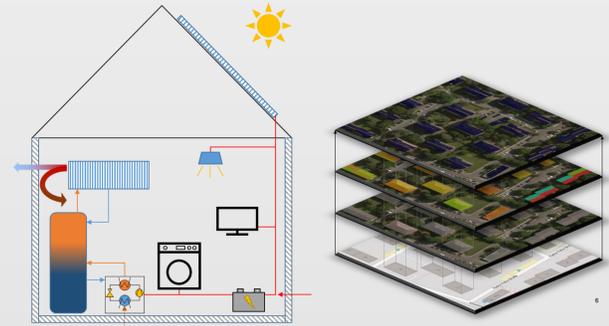

Motivation

yield: ? kWh/a
cost: ? €

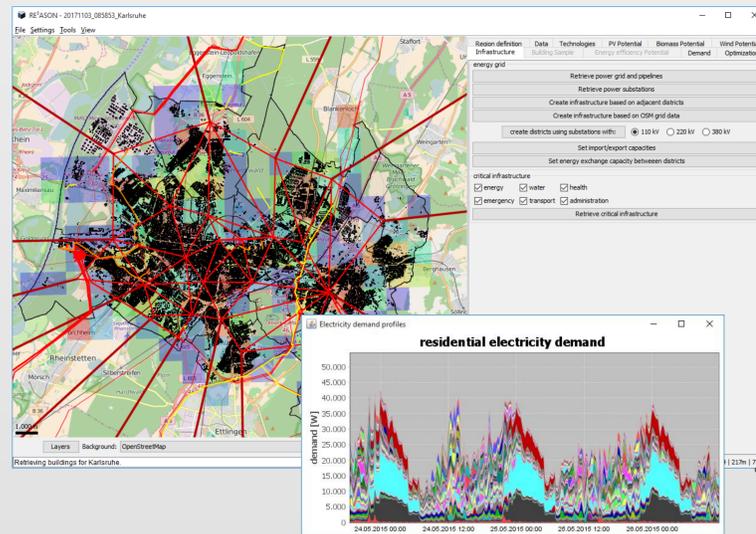

VS.

- Cities pursue sustainability goals
- Energy concepts are required
- Potential for renewable energies and energy efficiency improvement in cities
- The exact potential, the costs and which alternatives are best suited is unknown or expensive to assess
- System complexity due to interactions between different technologies, buildings and sectors
- Techno-economic evaluation of individual and combined measures necessary

Transferable methods for the analysis of urban energy systems

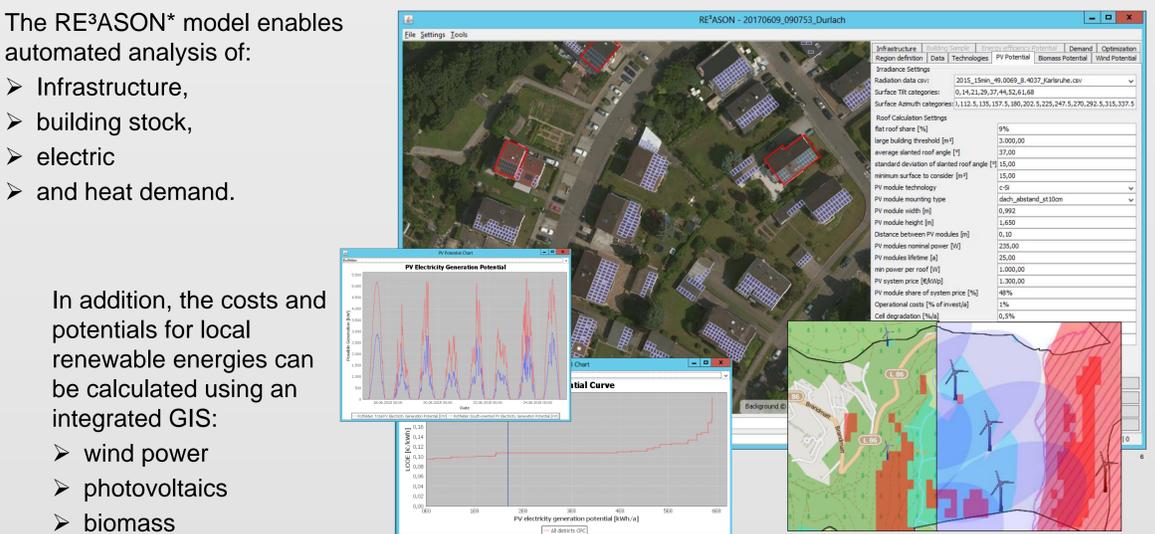

The RE³ASON* model enables automated analysis of:

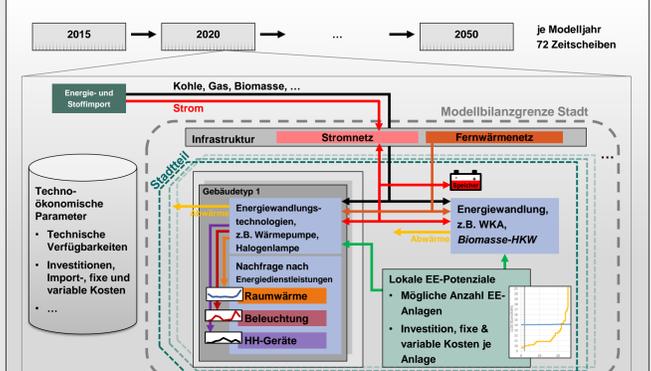

- Infrastructure,
- building stock,
- electric
- and heat demand.

In addition, the costs and potentials for local renewable energies can be calculated using an integrated GIS:

- wind power
- photovoltaics
- biomass

Techno-economical optimization of the urban energy system

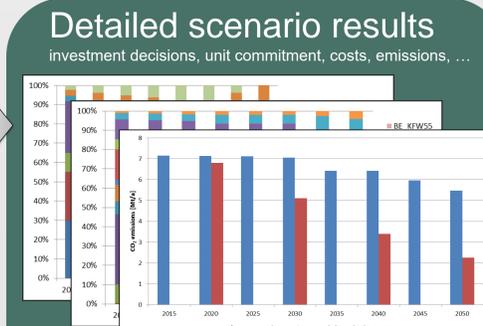

Techno-ökonomische Parameter

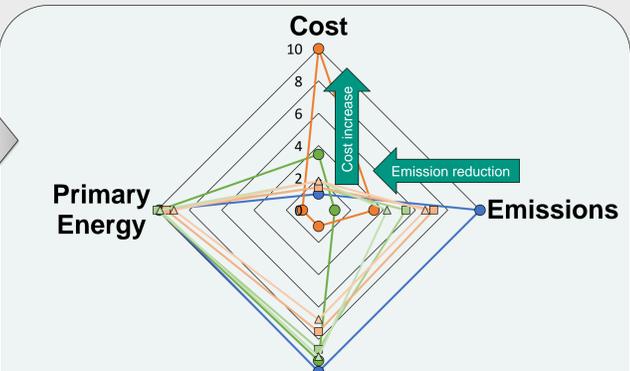

- Technische Verfügbarkeiten
- Investitionen, Import-, fixe und variable Kosten

Detailed scenario results

investment decisions, unit commitment, costs, emissions, ...

Scenario comparison

Scenarios:

- min cost
- min import
- min import w. 110% cost
- min import w. 120% cost
- min emissions
- min emissions w. 110% cost
- min emissions w. 120% cost

➢ Explore Trade-offs:
E.g. significant emission reduction can be achieved with only minor increase in costs

Results include:

- Required investments for energy generation & use
- Optimal degree of renewable energy utilization
- Reasonable technology combinations
- Development of costs, emissions, energy import and primary energy consumption for different emission reduction and cost scenarios
